So,

$$E(XY) = 19/2 \quad (2.0.10)$$

Let Z be a random variable defined as

$$Z = X - Y \quad (2.0.11)$$

Then,

$$E(Z) = E(X - Y) = E(X) - E(Y) \quad (2.0.12)$$

Using (2.0.1),

$$E(Z) = 0 \quad (2.0.13)$$

Now, variance of Z ,

$$Var(Z) = E(Z^2) - (E(Z))^2 \quad (2.0.14)$$

Using (2.0.13)

$$Var(Z) = E(Z^2) \quad (2.0.15)$$

$$Var(Z) = E((X - Y)^2) \quad (2.0.16)$$

$$Var(Z) = E(X^2 + Y^2 - 2XY) \quad (2.0.17)$$

$$Var(Z) = E(X^2) + E(Y^2) - 2E(XY) \quad (2.0.18)$$

Using (2.0.6), (2.0.7) and (2.0.10),

$$Var(Z) = 10 + 10 - 2 \times 19/2 \quad (2.0.19)$$

$$Var(Z) = 1 \quad (2.0.20)$$

Theorem 2.1. (Chebychev's Inequality) Let T be an arbitrary random variable, with finite mean $E(T)$, then for all $a > 0$,

$$\Pr(|T - E(T)| \geq a) \leq \frac{Var(T)}{a^2} \quad (2.0.21)$$

Applying Chebychev's Inequality for Z with $a = 6$, we get,

$$\Pr(|Z - E(Z)| \geq 6) \leq \frac{Var(Z)}{6^2} \quad (2.0.22)$$

1 PROBLEM

(GATE 2001 (MA), Q. 2.24) Let (X, Y) be a two-dimensional random variable such that $E(X) = E(Y) = 1/2$, $Var(X) = Var(Y) = 1$ and $Cov(X, Y) = 1/2$.

Then, $P(|X - Y| > 6)$ is

- | | |
|------------------|---------------------|
| 1) less than 1/6 | 3) equal to 1/3 |
| 2) equal to 1/2 | 4) greater than 1/2 |

2 SOLUTION

Given,

$$E(X) = E(Y) = 3 \quad (2.0.1)$$

$$Var(X) = Var(Y) = 1 \quad (2.0.2)$$

$$Cov(X, Y) = 1/2 \quad (2.0.3)$$

Now,

$$Var(X) = E(X^2) - (E(X))^2 \quad (2.0.4)$$

Substituting given values, we get,

$$1 = E(X^2) - 3^2 \quad (2.0.5)$$

So,

$$E(X^2) = 10 \quad (2.0.6)$$

Similarly for Y ,

$$E(Y^2) = 10 \quad (2.0.7)$$

Also,

$$Cov(X, Y) = E(XY) - E(X)E(Y) \quad (2.0.8)$$

Substituting given values, we get,

$$1/2 = E(XY) - (3)(3) \quad (2.0.9)$$

Using (2.0.13) and (2.0.20),

$$\Pr(|Z - 0| \geq 6) \leq \frac{1}{36} \quad (2.0.23)$$

As $Z = X - Y$,

$$\Pr(|X - Y| \geq 6) \leq \frac{1}{36} \quad (2.0.24)$$

So, option 1 is correct.
